Enterprise Business Platform · System Overview

ENTERPRISE BUSINESS PLATFORM

# Invisible ERP

One platform that unites back office, point of sale, customer relationships and loyalty — engineered on public-company internal-control principles.

Rigorously controlled, transparent, fully Thai-compliant and ready for international standards.

Developed by **Invisible Consulting**

CONTENTS

# What this presentation covers

0

SECTION

# Overview

What Invisible ERP is, and the value it creates for your business.

OVERVIEW · 0.1

# What Invisible ERP is

A business platform that unites the back office, point of sale, customer relationships and loyalty on a single architecture — smooth for the people who use it, while public-company controls govern every step behind the scenes.

**One platform, every cycle** from point of sale to inventory, procurement, production, accounting, close and tax — without stitching systems together.

**Genuinely built for Thailand** VAT and withholding tax, statutory and electronic tax invoices, PromptPay and LINE, on Thai business time.

**Isolation at the database layer** each company's data is separated by database row-level security, not merely by application code.

**Public-company internal control** hundreds of controls, maker-checker enforced even against the administrator, and an immutable audit trail.

**Customisable, with AI built in** no-code customisation and an AI assistant that inherits permissions and is fenced from the ledger.

OVERVIEW · 0.2

# Invisible ERP by the numbers

The platform's scale and depth reflect enterprise readiness.

**100+**
**business modules**
covering every cycle in one system

**282**
**documented controls**
fully documented, with no open gap

**23**
**segregation-of-duties rules**
evaluated automatically from real permissions

**110+**
**control test suites**
re-proving the controls on every release

Every figure is generated from the codebase, with a guard that forbids overstatement — so the numbers are verifiable.

OVERVIEW · 0.3

# One platform, four surfaces working as one

All four surfaces share one set of data, permissions and controls, so front-of-house transactions flow straight into accounting and analytics, with nothing to synchronise.

### Point of sale
**Retail & restaurant POS**
Retail selling, restaurant operations, offline working and delivery, posting to the ledger automatically.

### Back office
**The ERP core**
Inventory, procurement, production, accounting, finance, tax, people, projects and planning.

### CRM & loyalty
**Sales & relationships**
Pipeline, quoting, after-sales and loyalty tied to LINE and to the general ledger.

### Customer portal
**Self-service**
A portal for customers, branches and partners — dashboard, sales, stock and order tracking.

OVERVIEW · 0.4
## The business value you receive

### Lower system cost
Replace separate POS, accounting, CRM and inventory systems with one platform, cutting licence and integration costs.

### Fraud prevention built in
Maker-checker, segregation of duties and receiving controls reduce the risk of losing cash and stock.

### Close the books faster
A close cockpit, automatic reconciliation and a ledger balanced by construction shorten the close.

### Decide on live data
Analytics that drill to the ledger, real-time metrics, forecasting and questions asked in Thai.

### Ready for audit and capital
A complete control set, readiness for international standards and an immutable audit trail build credibility.

### Grow without a ceiling
Support many branches, companies, accounting standards and currencies, with an open API.

# 1

SECTION

# Where Invisible leads

Advantages that are not features but architectural decisions competitors cannot easily copy.

WHERE WE LEAD · 1.1

## Nine things you will not find elsewhere

### Tamper-evident fiscal journal
A cryptographically chained fiscal journal to Revenue-Department standards; altering a past entry breaks every entry after it.

### Maker-checker that binds admins
Even the administrator cannot approve their own work at any point that touches cash.

### Budgets you can enforce
A budget gate halts over-budget requisitions, with concurrency-safe reservation.

### AI fenced from the ledger
The assistant shares the app's path, inherits permissions, and can only propose for human approval.

### Multi-GAAP and IFRS
Parallel ledgers, cross-currency consolidation, revenue, leases and financial instruments in full.

### Offline that truly works
The app keeps selling — quick sales and dine-in — through an outage, then replays exactly once.

### Points booked as a liability
Points are a booked liability under the standard, with intercompany clearing across a coalition.

### LINE-native throughout
Ordering, approvals, receiving, loyalty and assistance run over LINE with controls intact.

### Controls that test themselves
Most controls carry an automated test that runs on every release.

WHERE WE LEAD · 1.2

## Invisible ERP versus a typical system

| Capability | Invisible ERP | A typical system |
|---|---|---|
| **Multi-company isolation** | At the database, refusing to start if misconfigured | Application code only |
| **Internal control** | Hundreds of controls, tested on every release | Static narrative documents |
| **Maker-checker** | Enforced even against the administrator | Admins can approve their own work |
| **Thai tax** | Signed e-Tax invoices and complete returns | Basic VAT and file export |
| **Revenue recognition** | The standard in full, all five steps | Straight-line deferral |
| **Artificial intelligence** | Inherits permissions, fenced from the ledger | A bolt-on chatbot |
| **Offline operation** | Keeps selling and replays exactly once | Requires a constant connection |

WHERE WE LEAD · 1.3

## Why these advantages are hard to copy

Invisible's differences are not surface features but architectural decisions embedded throughout the system — matching them would require rebuilding it.

**Control by default** the system refuses to start if misconfigured for a leak, so security cannot be switched off by accident.

**Self-proving controls** automated tests re-prove the controls on every release, not by an annual sample.

**Balanced by construction** every entry is balanced and idempotent by design, so the books cannot drift silently.

**Locked financial logic** financial logic is pinned, and an unintended change fails the automated checks.

**Honesty by enforcement** a guard forbids overstatement, so the figures presented can be trusted.

**Localisation to the letter of the law** more than translation — digital signatures and file formats that file with the authorities.

**A single data spine** front-of-house data flows into accounting and analytics at once — the numbers you see are real-time.

**Many standards, one posting** post once into every standard, isolating adjustments, so the book-tax difference is measured cleanly.

2

SECTION

# Security & control

Engineered to withstand penetration testing and public-company audit, with secure-by-default settings.

SECURITY · 2.1

## Security by the numbers

Reviewed independently twice in 2026 — an internal penetration test and an external expert review — with every finding remediated.

**282**
**documented controls**
fully documented, with no open gap

**22**
**findings closed**
from the external review, all fixed and merged

**23**
**segregation rules**
evaluated from real user permissions

**344**
**isolated tables**
isolated at the database layer

The internal test identified one critical, six high and eight medium findings, all remediated and re-verified.

SECURITY · 2.2

## Separation of data between companies

### At the database, not the application

**Row-level security** every table has a policy tied to the company and forced, so even the table owner is subject to it.

**Transaction-local context** the company context is set only within a transaction, so it never bleeds across shared connections.

**Identity from a signed token** the company and role come only from a server-signed token and cannot be forged through request headers.

### Refuses to start if a leak is possible

**Pre-boot checks** the system will not start if the database role can bypass security.

**A least-privilege role** production connects with a non-privileged role, with no opt-out.

**Continuous verification** tests prove isolation on a real database on every release.

SECURITY · 2.3

## Application-level security

Hardened to international security standards, then reviewed by independent experts, with secure-by-default settings.

**Content security policy**
injected scripts are refused, closing the cross-site-scripting gap.

**Server-side request protection**
blocks calls to internal addresses and re-validates at send time.

**Signed webhook authentication**
verifies a signature over the raw body within a time window, preventing forgery and replay.

**Keys as maker, not approver**
a service key adopts its human creator, so it cannot self-approve.

**Secrets encrypted at rest**
tokens and secrets are encrypted with key rotation, and none are hard-coded.

**Sessions & rate limiting**
tokens sit in cookies scripts cannot read, with instant revocation and login rate limits.

SECURITY · 2.4

# Public-company internal control

### A self-testing control matrix

**Controls generated from code** hundreds of controls mapped to international frameworks, generated from source so they cannot drift.

**Automated effectiveness tests** tests re-prove the controls on every release, so a regression cannot ship.

**Maker-checker across the system** journals, payroll, stock counts and pricing all require an approver different from the maker.

### Segregation and exception control

**Rules evaluated automatically** evaluated from real permissions, blocking at grant time and reporting conflicts.

**Exceptions need two signatures** a justified exception must be approved by a different person and logged.

**Financial outputs pinned** accounting, procurement and analytics outputs are compared to a baseline, catching unintended change.

SECURITY · 2.5

# IT controls, audit trail and standards

### Immutable audit trail

append-only, with edits and deletes refused at the database, and tampering detectable.

### Field-level change log

captures before-and-after values on core financial tables at the database, un-bypassable by code.

### Access recertification

periodic access reviews where a revocation actually removes access and ends sessions.

### Multi-factor authentication

enforced for finance and high-privilege roles, with quick-PIN login restricted.

### Standards & privacy

one evidence base serves several standards, and the right to erasure coexists with an immutable trail.

### Change management & operations

code review, deployer-separated-from-author, tested backups and a continuity plan.

3

SECTION

# Point-of-sale modules

The full front-of-house footprint — from selling and restaurant operations to shifts, devices and delivery channels.

POINT OF SALE · 3.1

## Selling and restaurant operations

Sixteen selling modules, grouped by frontline service, dining and shift close — each posting to the ledger and governed by segregation of duties.

| | | | |
|---|---|---|---|
| **Register**<br>Touch register & app | **Orders**<br>Order management | **↺ Returns**<br>Returns & refunds | **฿ Refund approval**<br>Separate authority |
| **Gift cards**<br>Stored value | **Printing**<br>Receipts & slips | **Tables**<br>Floor plan & status | **Reservations**<br>Booking & queue |
| **Kitchen display**<br>States & prep time | **Menu**<br>Items & modifiers | **Buffet**<br>Per-head pricing | **Tips**<br>Tip distribution |
| **POS control**<br>Front-of-house oversight | **฿ Till**<br>Open & close shift | **Close of day**<br>End-of-day report | **Quick PIN**<br>Fast sign-in |

STORE & DEVICES · 3.2

## Store, devices and analytics

Store management, peripherals, delivery channels and restaurant analytics, connected seamlessly to inventory, procurement and loyalty.

| | | | |
|---|---|---|---|
| **Claims**<br>Product claims | **Delivery**<br>Fulfilment | **Delivery channels**<br>External platforms | **Peripherals**<br>Printers & drawers |
| **Card terminals**<br>Card acceptance | **Payment accounts**<br>Tender accounts | **Food cost**<br>Cost per dish | **Restaurant analytics**<br>Menu engineering |
| **Production plan**<br>Kitchen prep | **Loyalty at POS**<br>Member operations | **Fiscal journal**<br>Electronic tax | **Store requisition**<br>Supply ordering |

4

SECTION

# ERP modules

The full back-office footprint, organised into domains — from sales and supply chain to finance, people, projects and planning.

SALES & SUPPLY CHAIN · 4.1

## Customers, selling and supply chain

| | | | |

5

SECTION

# Module deep dive

Each module in depth — its capabilities, controls and distinctive strengths, with referenceable control identifiers.

POINT OF SALE & RESTAURANT [FLAGSHIP]

# A full-service point of sale for retail and restaurants

**Role** It handles seat-level dine-in service, a kitchen display system, QR self-ordering and PromptPay payment, keeps selling through an internet outage, and posts every sale to the general ledger automatically — into a tamper-evident fiscal journal that meets the Revenue Department's unalterable-record requirement.

### Seat-level dine-in

Order by seat and course, fire to the kitchen in sequence, subtotal per seat, and split the bill by seat in one tap.

### Kitchen Display System

Live order states with prep-time alerts, item recall, and an expo/station-load view of kitchen workload.

### QR self-order & PromptPay

Guests scan, order and pay themselves; every price is computed server-side, so it cannot be tampered with.

### Floor plan & table ops

Arrange tables and zones freely; move, merge and transfer checks, with revenue reported by room.

### Buffet & split bill

Per-head buffet pricing with overtime fees; split equally, by item or by seat, each with its own tax invoice.

### Guest profile & allergens

Remembers favourites and allergies, flags them live on every kitchen ticket, and removes them the moment consent is withdrawn.

POINT OF SALE & RESTAURANT · continued

# Cash integrity and front-of-house fraud prevention

### Controls & segregation of duties

**REST-02** — A hash-chained fiscal journal: altering any past entry breaks the checksum of every entry after it.

**REST-03** — A 50% discount ceiling; anything beyond it requires a shift-manager's approval.

**TIP-01** — Tip distribution is segregated from the cashier duty, so no one can pay tips to themselves.

**REST-11** — Every cash-drawer opening is logged with a reason and reconciled against the Z-report.

### Where it stands out

A cryptographically tamper-evident fiscal journal — not merely an activity log — whose verification pinpoints exactly where any change occurred.

Guests order and pay entirely on their own, with no exposure to price tampering.

Keeps operating offline for both quick sales and dine-in kitchen firing, then replays to the cloud exactly once.

Allergen alerts appear on every kitchen ticket in real time and disappear instantly when consent is withdrawn.

**Key screens** /pos/register /kds /tables /pos/till /buffet /track/{token}

MEMBERSHIP & LOYALTY [LINE-NATIVE]

# A loyalty program tied to the general ledger

**Role** It is concurrency-safe, accounts for points under TFRS 15, and puts LINE identity at its core. Missions, referrals, spin-to-win, tiers and a partner coalition all sit on top — and points are a real sub-ledger that reconciles to the loyalty-liability account (2250).

### Points & tiers

Accrual and redemption run under database locking, so no points are lost under concurrency, with automatic tier promotion and full history.

### Rewards & missions

Redeem for vouchers, discounts, products or privileges, with stamp cards and member-get-member referrals rewarded exactly once.

### Provably-fair spin-to-win

A cryptographic server-side draw that guests cannot influence, with atomic prize-stock protection.

### Campaigns & journeys

Broadcast by RFM segment, tier or birthday, always honouring consent and quiet hours.

### Coalition network

Earn and burn across a franchise, posting a balanced intercompany clearing entry at fair value automatically.

### Closed-loop NPS

Post-purchase surveys carry no PII in the URL, and a low score automatically opens a 24-hour service-recovery case.

MEMBERSHIP & LOYALTY · continued

# Points are a booked liability

### Controls & segregation of duties

**MKT-03** — Accrual and redemption are concurrency-safe, and setting point value is segregated from cashiers.

**MKT-06** — The points liability is accrued automatically and expired points are de-recognised systematically.

**LYL-17** — Points from customer-uploaded receipts require a second reviewer and are protected against duplicates.

G13 — Staff-initiated point transfers above 500 points require approval from a different authoriser.

### Where it stands out

Points are booked as a liability (account 2250) under TFRS 15, with automatic accrual and breakage at period close.

A coalition lets members earn and burn anywhere, with the intercompany clearing entry always balanced.

A cryptographically provably-fair prize wheel, with every spin recorded.

A poor satisfaction score becomes a time-bound recovery case rather than vanishing silently.

**Key screens** /loyalty /loyalty/members/:id /loyalty/journeys /loyalty/receipt-approvals /m

CRM, PIPELINE & CPQ

# Sales and after-sales on a single customer spine

**Role** A single customer record carries the pipeline board, opportunity management, a margin-enforcing quote engine and the full after-sales workspace. A 360-degree view brings receivables, credit limit, deals, quotes and loyalty together on one screen, so sales sees the financial picture before every conversation.

### CRM workspace

A drag-and-drop board with configurable stages, list views, saved filters and a unified activity timeline per deal.

### Lead capture & management

Bulk import, web-to-lead forms and explainable lead scoring, with a follow-up centre governed by service-level targets.

### Customer 360

Brings credit status, overdue balances, open deals, quotes and loyalty for the same customer into one view.

### Margin-enforced quoting

Prices computed server-side; a quote cannot be accepted until it clears the minimum-margin floor, and bundles cannot slip past it.

### After-sales & contracts

Service contracts with SLAs, subscription billing, warranty and support cases with automatic email-to-case.

### Warranty & entitlement

Entitlement is checked automatically at claim time: in-warranty is free instantly, out-of-warranty waits for an independent approver, with an exceptions register for audit.

CRM, PIPELINE & CPQ · continued

# No below-margin sale without a second signature

### Controls & segregation of duties

**CPQ-01** — A discount or margin below policy is held, and the quote cannot be accepted until an independent approver clears it.

**CPQ-03** — Accepting a revenue-bearing quote must be done by someone other than its author.

**SVC-01** — Granting a free claim outside warranty coverage requires an independent approver.

R09 / R10 — Credit master data and pricing rules are segregated from the selling function.

### Where it stands out

A sale below the margin floor is blocked until an independent approver clears it, and bundles cannot conceal a blended discount.

Customer 360 unites credit risk, arrears, deals, quotes and loyalty tier ahead of every conversation.

Warranty entitlement is verified automatically at claim time, and every free out-of-coverage grant is logged for auditors.

From lead to after-sales, everything sits on one customer record with an append-only stage history.

**Key screens** /crm /crm/deals/{OPP} /service /service/warranty /service/renewals /cpq

MARKETING, PRICING & PROMOTIONS

# No price or discount goes live unreviewed

**Role** Every price and discount-rule change requires a second person's approval, and the pricing engine reads only approved rules. On top sit campaign and segment management, A/B testing with genuine statistical significance, margin-honest ROI reporting, and consent-gated, hash-only audience export under PDPA.

### Campaigns & segments

On/off campaigns, RFM-based segments, abandoned-cart nudges and satisfaction surveys.

### Promotions & pricing rules

A full range of promotion types and pricing rules gated by day, time and channel.

### Closed-loop LINE marketing

Behaviour-triggered personal coupons measured through to redemption, with deterministic A/B and holdout groups.

### Trustworthy A/B testing

Reports real confidence intervals and p-values, and flags when a sample is too small to conclude.

### Margin-honest ROI

Treats discount as cost, not revenue, and measures incremental lift against a holdout baseline.

### Consent-gated audience export

Exports only hashed values to Meta and Google under live consent, and syncs consent withdrawals back automatically.

MARKETING, PRICING & PROMOTIONS · continued

# A discount is inactive until someone approves it

### Controls & segregation of duties

**MKT-01** — Pricing and promotion rules stay inactive until a different person activates them, and the engine reads only approved rules.

**MKT-02** — Promotion usage limits are enforced atomically, preventing over-use.

**REV-20** — Voucher-campaign activation requires a second approver, and each code redeems only once.

**PDPA-05** — Audience export requires a recorded processing activity and live consent, and emits hashed values only.

### Where it stands out

A discount cannot take effect until another person approves it, so margin is never given away quietly.

A/B tests do not mislead: real confidence intervals and p-values, with a warning when the sample is underpowered.

Push audiences to Meta and Google with no PII leaving, and a withdrawal actively removes the member.

ROI measures incremental lift against a holdout and counts discount as a cost.

**Key screens** /marketing /settings/messaging /crm/audience-export /reputation /mmm

RETURNS & STORED VALUE

# Refunds and gift cards recorded atomically

### ↺ Returns & refunds

**One atomic transaction** Refund, restock, return record and ledger reversal all commit together, or none of them do.

**Pro-rated refunds** Value and VAT are computed in proportion to the quantity returned.

**Over-return guards** Cumulative checks prevent returning or refunding more than was sold or paid.

**Segregated authority** Refund approval is separated from processing and hidden from cashiers at the screen level.

### Gift cards & store credit

**Cards are a liability** Up to 5,000 THB issues instantly; above that waits for an independent finance approver.

**Double-spend protection** Redemption runs under row-level locking, so a card cannot be spent twice.

**Full sub-ledger** Records every issue, redemption and top-up, reconciled to account 2200.

**First-class store credit** A refund to store credit mints a real, fully sub-ledgered card.

PROCUREMENT / PROCURE-TO-PAY

## A procure-to-pay cycle segregated at every step

**Role** From requisition to purchase order, goods receipt, three-way match and payment, each step lives on its own screen and duty. It pairs a consumer-grade buying experience with maker-and-checker control at every decision, so the business pays only for goods that were properly ordered, actually received, at the agreed price, from an approved vendor.

### Requisitions & internal shop

Anyone can request through a searchable catalogue, with favourites, cross-device saved baskets and barcode scanning.

### Ordering via LINE

Create, approve and receive through LINE chat; every path runs the same workflow as the web, so segregation of duties holds identically.

### Purchase orders & RFQ

Issue RFQs and multi-currency purchase orders, flagging capital lines to route into the fixed-asset register.

### Blind-count receiving

The ordered quantity is never pre-filled, over-receipt is controlled, and a photo-evidenced claim window opens at the dock.

### Three-way match & AI intake

Scan an invoice; the system extracts it, matches the purchase order, books the bill and runs the three-way match in one flow, rejecting duplicates.

### Vendor scorecards & portal

Rank vendors by on-time delivery, quality and price variance, with a portal for suppliers to acknowledge orders and submit invoices.

PROCUREMENT / PROCURE-TO-PAY · continued

# Closing fraud gaps at every payment decision

### Controls & segregation of duties

R03 / R04 / R07 — Buyer, receiver and approver are different people, and receiving requires its own dedicated permission.

**EXP-06** — Vendor payment requires a distinct requester and approver, enforced even against the administrator.

**EXP-11** — Changing a vendor's bank account requires second approval and is encrypted at rest, defending against business-email fraud.

**EXP-13** — A payment run separates proposer, approver and executor, and the bank file is cryptographically pinned to the approved run.

### Where it stands out

Order through LINE with the controls intact — every path runs the same workflow as the web.

AI intake extracts, matches, books and three-way-checks the bill on its own, and refuses duplicate invoices.

Blind-count receiving deters confirming without counting, with a claim window and dock-photo evidence.

Business-email-fraud defence is built in — payee accounts are locked and the payment file is bound to the approved run.

**Key screens** /requisitions /shop /receiving /procurement/match /procurement/ap-intake /disbursements

INVENTORY, WAREHOUSE & COSTING

# A perpetual, valued inventory that ties to the ledger every period

**Role** A perpetual, valued sub-ledger that keeps stock complete, prevents overselling, costs consumption correctly and reconciles to the inventory control account every period. It spans a modern warehouse operation and a full costing engine, with maker-and-checker control over every value-affecting move.

### Perpetual valued ledger

Every receipt, issue and adjustment posts a balanced, idempotent entry, with a reconciliation banner against the control account.

### Flexible costing methods

Choose moving-average, or FIFO / FEFO cost layers for perishables with expiry.

### Landed-cost allocation

Capitalise freight, duty and insurance into unit cost, with maker-checker standard-cost revisions.

### Risk-based cycle counting

The counter is separated from the poster, items are ranked by value, and counts are blind to the book quantity.

### Transfers & transfer orders

Two-step inter-warehouse transfers through a goods-in-transit account, with a different shipper and receiver, and in-transit aging.

### 3D warehouse & lot recall

A 3D warehouse coloured by utilisation, over-fill protection, and two-way lot recall with quarantine from picking and sale.

INVENTORY, WAREHOUSE & COSTING · continued

# Inventory value that proves itself

### Controls & segregation of duties

R11 — The person who adjusts stock and the person who counts it are different, on separate screens.

**INV-01** — No overselling, enforced by row-level locking at pick and issue.

**INV-07** — Write-offs require a second approver, enforced even against the administrator.

**COST-01** / COST-02 — The preparer of a cost change and the person who posts it are different.

### Where it stands out

A 3D warehouse you can orbit, coloured by capacity, that highlights where an item sits — with hard over-fill protection.

Every move posts a balanced, idempotent entry and reconciles to the control account, so the value always ties out.

Risk-based counting ranks items by value and hides the book figure, making shrinkage hard to conceal.

Recall a lot in one click, with two-way genealogy and a hold that removes it from picking and sale.

**Key screens** /inventory /inventory-ledger /wms /lots /stock-ops/cycle-counts /costing/landed-cost

MANUFACTURING

# From bill of materials to finished goods, with finite-capacity scheduling

**Role** A costing engine that keeps work-in-process, finished goods and cost of sales valid, complete and properly cut off, with every posting balanced and idempotent. On top sit multi-level material planning, capacity checking and finite-capacity scheduling, over a maker-and-checker bill-of-materials governance.

### BOM & work orders

Define and distribute bills of materials with maker-checker approval, and run a status-controlled work-order lifecycle.

### Material issue & variances

Issue materials into work-in-process and close with yield variance recognised, so anomalies are not hidden in finished-goods cost.

### Material requirements planning

Explode multi-level bills, net against on-hand stock and consolidate buys into a requisition, keeping planning separate from purchasing.

### Finite-capacity scheduling

Sequence operations onto work centres by precedence and daily capacity, producing start-finish times, dispatch queues and late-job alerts.

### Costing configuration

Set the costing method per company and item, and value inventory in a way that reconciles to the control accounts.

### Real-time analytics

Stream production metrics to a dashboard that updates in real time.

MANUFACTURING · continued

# Manufacturing cost that is honest about variance

### Controls & segregation of duties

**MFG-02** — Work-order issue and completion post balanced, idempotent entries with yield and material-usage variances recognised.

**MFG-01** — Bills of materials are centrally governed and approved through maker-checker.

R04 / R13 — The work-order creator is separated from the receiver, and BOM maintenance from transacting.

**COST-02** — A standard-cost revision requires a distinct preparer and approver.

### Where it stands out

Finite-capacity scheduling produces a real per-operation schedule with start-finish times, dispatch queues and late-job alerts.

Honest completion: short yield is booked separately, never capitalised into finished-goods cost.

Material planning becomes a real requisition, while planning stays segregated from purchasing.

Every posting is balanced and idempotent, so repeating an action has no double effect.

**Key screens** /manufacturing /production /production/schedule /costing /bom

QUALITY MANAGEMENT

# No inspector closes a quality case on their own signature

**Role** An end-to-end quality system that closes the largest control gap in the quality cycle: no inspector can scrap stock, release out-of-spec goods, requalify a supplier or close a corrective action on their own signature. Non-conformance, corrective action, supplier corrective action and certificates of analysis each require an independent second approver.

### Non-conformance register

Record and manage non-conformances through their lifecycle, with financially-material dispositions held for approval.

### Corrective & preventive action

Manage the corrective loop with action items and an effectiveness sign-off that reopens the case if it did not work.

### Supplier corrective action

Run supplier corrective-action requests in a standard format, where the effectiveness verdict governs requalification.

### Certificate of analysis

Define quality specs per item, evaluate pass/fail, and release out-of-spec goods through a deviation register.

### Disposition & scrap

Decide accept, rework, quarantine or scrap, and write the lost value to a loss account.

### Waste capture

Capture waste by reason and disposition, comparing actual against theoretical usage.

QUALITY MANAGEMENT · continued

# Every disposition needs a second signature

### Controls & segregation of duties

**QC-01** — Disposing of a non-conformance must be done by someone other than the person who raised it, enforced even against the administrator.

**QC-02** — Closing a corrective action requires an independent effectiveness verifier, and an ineffective result reopens the case.

**QC-03** — Releasing out-of-spec goods requires a distinct recorder and approver, with a reason.

**QC-04** — Closing a supplier corrective action must be done by someone other than the raiser, with complete documentation.

### Where it stands out

Scrap cannot be self-signed; every financial disposition is held until another person approves, and the journal number is shown.

A corrective action is verified by an independent party, and an ineffective result reopens it rather than closing over a live problem.

Supplier corrective action is tied to requalification, closing only when the documentation is complete and the result satisfactory.

The certificate-of-analysis deviation register is exactly the population an auditor tests.

**Key screens** /quality/ncr /quality/capa /quality/scar /quality/coa

MASTER DATA MANAGEMENT

# One engine governs all master data and guards against fraud

Import, export, per-row validation and second approval for sensitive fields work identically across vendors, items, prices and promotions.

### One import-export engine
**Export, edit in a spreadsheet, dry-run validate, then commit, with per-row errors in Thai and English.**

teal

### Two-signature sensitive fields
**Credit limits, payment terms, prices and discounts are held and released only by an independent approver.**

coral

### Duplicate detection & merge
**Detect duplicates and merge records, repointing children, retaining the fuller data and retiring the loser without deletion.**

violet

### Immutable change history
**Capture every change at the database layer, append-only, with sensitive fields masked.**

cyan

### No-code custom fields
**Add typed fields to any entity without code, validated server-side.**

gold

### Focused setup surfaces
**Manage item categories and tax codes through the same engine, scoped to narrow permissions.**

green

FINANCE — RECEIVABLES & PAYABLES

# A working-capital hub for receivables and payables

**Role** It unites the receivables and payables cycles on one screen, with statements, cross-invoice settlement, a maker-checker disbursement flow, credit control, advances and automated collections. Every point that touches cash is segregated and posts to the ledger automatically.

### Customer & vendor statements

Show opening balance, movements and running balance in multiple currencies, with export and attachment.

### Cross-invoice cash application

Apply one payment across several invoices, parking the remainder on account, with large batches requiring second approval.

### Segregated disbursement

Accounting requests payment on one screen; finance approves and releases the cash on another.

### Payment runs & Thai bank files

Pay many vendors at once, generating Thai and international bank files cryptographically pinned to the approved run.

### Credit control

Limit changes and hold releases require a second approver, and holds reach the point of sale and customer portal.

### Advances & petty cash

Manage advances and imprest petty-cash funds, with early-payment discounts.

FINANCE — RECEIVABLES & PAYABLES · continued

# Truly separate teams: the requester is not the releaser

### Controls & segregation of duties

**EXP-06** — Vendor payment requires a distinct requester and approver, enforced even against the administrator.

**REV-08** — Changing a credit limit or releasing a hold requires a second approver.

**REV-12** — Customers over their limit or seriously overdue are placed on hold, reaching the point of sale and the portal.

**REC-02** — Bank reconciliation requires a distinct preparer and certifier.

### Where it stands out

Two genuinely separate screens: accounting requests, finance releases, so no one both records and pays.

Ready-to-use Thai bank files, cryptographically pinned to prove the file sent is the file approved.

Credit holds reach the point of sale and customer portal, on the same threshold as collections.

Multi-currency statements retain the booked exchange rate per document.

**Key screens** /finance /finance/customers /disbursements /finance/credit-hold /advances

GENERAL LEDGER & CLOSE

# A ledger balanced by construction, with a close cockpit

**Role** A double-entry core that is balanced by construction, with maker-and-checker control enforced even against the administrator. Period close runs through a readiness cockpit, with variance analysis and a disclosure checklist, designed to pass internal-control review directly.

### Controlled journal entries

Manual entries post as drafts, excluded from balances until another person approves; every entry is balanced and idempotent.

### Statements & cash flow

Produce the trial balance, income statement, balance sheet and a cash-flow statement that ties to actual cash by construction.

### Recurring & prepaid

Schedule recurring entries and amortise prepaid costs automatically, through maker-checker approval.

### Governed chart of accounts

A shared canonical chart with a per-company overlay, protecting control accounts from direct posting.

### Posting rules & overrides

Configure posting rules in detail, with overrides requiring approval and key accounts locked.

### Period & year-end close

Close periods after reconciliations are certified, and roll year-end into retained earnings automatically.

GENERAL LEDGER & CLOSE · continued

# Internal-control evidence ready for audit

### Controls & segregation of duties

**GL-05** — Manual entries require a distinct preparer and approver — including go-live opening balances.

**GL-02** — Posting into a closed period is blocked, and the person who closes it differs from the one who opened it.

**REC-04** — A period-end control-account pack ties receivables, payables, inventory and deferred revenue in one view.

**GL-25** / GL-26 — Variance analysis requires explanations and sign-off, and a disclosure checklist follows the standards.

### Where it stands out

Opening balances go through the same maker-checker, so the most material entries are not set by a single person.

The close cockpit answers one question — are we ready to close — in red and green, without opening many screens.

Variance analysis with mandatory explanations and a disclosure checklist form ready-made control evidence.

All three cash-flow statements reconcile to actual cash by construction.

**Key screens** /accounting /chart-of-accounts /finance/close-cockpit /close/flux /close/disclosure

MULTI-GAAP, CONSOLIDATION & FX

# Post once, report under many standards, with international consolidation

**Role** A parallel-ledger architecture posts once into every ledger yet isolates adjustments to a single one. Group consolidation supports dual-rate translation, a cumulative translation adjustment in other comprehensive income, and a consolidated cash-flow statement. FX revaluation runs automatically with auto-reversal.

### Parallel ledgers

Support TFRS, tax and IFRS bases, where shared entries reach every ledger and adjustments post to just one.

### Standard comparison

Compare accounting and tax bases; shared entries cancel, leaving the real difference to feed deferred tax.

### Intercompany transactions

Post both sides with due-from and due-to accounts, with settlement and elimination when balances agree.

### Consolidation

Consolidate by ownership with non-controlling interest and eliminations, asserting a balanced trial balance before posting.

### Dual-rate translation

Translate the income statement at the average rate and the balance sheet at the closing rate, parking the difference in other comprehensive income.

### FX revaluation

Revalue open foreign-currency receivables and payables, auto-reversing at the start of the next month.

MULTI-GAAP, CONSOLIDATION & FX · continued

# International cross-currency consolidation that always balances

### Controls & segregation of duties

**GAAP-02** — Per-ledger adjustments must pass maker-checker approval.

**CON-03** — If the consolidated trial balance does not balance, the whole run is rolled back, and posting requires a second approver.

**REC-03** — Intercompany reconciliation must be signed off before a consolidation run.

**FX-04** — A manually entered rate is unusable until approved, guarding against keying errors.

### Where it stands out

Post once for several standards, isolating only the adjustments, so the book-tax difference is measured cleanly.

Dual-rate translation with a cumulative adjustment in other comprehensive income and a consolidated cash-flow statement, to international standards.

If eliminations unbalance the group, the run is rolled back, so the consolidated statements can never be quietly out of balance.

A wrong rate cannot post, because only approved rates are used for revaluation and reporting.

**Key screens** /consolidation /intercompany /fx /ic-reconciliation

REVENUE RECOGNITION

# Five-step revenue recognition, in full

**Role** A revenue engine that implements TFRS 15 and IFRS 15 across all five steps, covering contract assets and liabilities, progress billing, variable consideration with constraint, contract modifications, a financing component and the disclosure pack. Every management judgement is recorded and approved through maker-checker.

### Five-step engine
Identify contracts and performance obligations, allocate by standalone selling price, and recognise through controlled postings.

### Contract assets & liabilities
Decouple billing from recognition; recognition ahead of billing becomes a contract asset, and billing requires a second approver.

### Variable consideration
Estimate by expected value or most-likely amount, with a constraint, adjusting cumulatively on approval.

### Contract modifications
Classify as a separate contract, prospective or cumulative catch-up, where the classification itself is the control.

### Financing component
Discount to present value and unwind interest at the effective interest rate.

### Disclosure pack
Produce the contract-liability rollforward and remaining performance obligations, reconciled to the ledger.

REVENUE RECOGNITION · continued

# Every management judgement needs a second approver

### Controls & segregation of duties

**REV-24** — Milestone billing must be done by someone other than the person who prepared it.

**REV-25** / REV-26 — Variable-consideration estimates and contract modifications must be approved before driving revenue.

**REV-27** — The discount-rate judgement for the financing component passes maker-checker approval.

**REC-01** — Deferred revenue reconciles to the ledger on a regular basis.

### Where it stands out

The revenue standard implemented in full — contract assets and liabilities, variable consideration, modifications and a financing component.

Contract-asset reclassification ties by construction: the asset equals revenue recognised less amounts billed.

An unapproved estimate cannot drive revenue, so every judgement becomes audit-ready evidence.

The disclosure rollforward is reconstructed from actual journal lines, so it reconciles by construction.

**Key screens** /revenue /api/revenue/contracts /api/revenue/disclosure

FIXED ASSETS, LEASES & DEFERRED TAX

# A full asset lifecycle, with lease accounting and deferred tax

**Role** It spans the asset lifecycle from capitalisation at goods receipt through depreciation, revaluation and impairment to disposal, with IFRS 16 lease accounting for both lessee and lessor, maintenance work orders, and a parallel tax-depreciation book that feeds deferred tax.

### Register & capitalisation

Capitalise assets directly from goods receipt, with traceability from requisition to purchase order and receipt.

### Depreciation

Compute monthly depreciation idempotently per company and period, capped at residual value.

### Revaluation & impairment

Revalue upward into a surplus reserve and, on disposal, recycle it directly to retained earnings, via second approval.

### Lessee & lessor leases

Recognise right-of-use assets and liabilities at present value, with a lease-liability reconciliation banner on screen.

### Asset maintenance

Manage repair work orders and preventive-maintenance schedules, with reliability metrics.

### Deferred tax

Maintain a parallel tax-depreciation book that feeds deferred-tax assets and liabilities from real differences, via second approval.

FIXED ASSETS, LEASES & DEFERRED TAX · continued

# Lease accounting on both sides, with a real tax book

### Controls & segregation of duties

**FA-08** / FA-09 — Asset revaluation and disposal pass maker-checker approval.

**FA-10** — Capitalising from goods receipt requires a distinct requester and approver.

**LSE-01** — The lease liability reconciles to the payment schedule on screen.

**TAX-06** — Posting deferred tax requires a distinct runner and poster.

### Where it stands out

IFRS 16 lease accounting for both lessee and lessor, with a liability reconciliation banner on screen.

A parallel tax-depreciation book feeds deferred tax from real differences, with no manual adjustment.

Capitalisation from goods receipt is fully traceable and removes the capital line from inventory automatically.

QR-scan verification and an exceptions report form a detective control over the physical existence of assets.

**Key screens** /assets /leases /eam /deferred-tax

TAX & COMPLIANCE [THAI-COMPLIANT]

# A complete Thai tax suite with digitally signed e-Tax invoices

**Role** It covers value-added tax, withholding tax, statutory tax invoices, digitally signed e-Tax invoices, tax returns and the income-tax provision with an effective-tax-rate reconciliation — and every tax figure reconciles to the ledger before filing.

### Per-country tax rates

Configure a tax provider per country, with no rate hard-coded in the software.

### Tax invoices

Issue gapless numbers, handle voids while retaining the number, and convert abbreviated invoices to full ones.

### Electronic tax invoices

Generate standards-based documents with a digital signature and embedded file, and do not resend once accepted.

### Credit notes & reverse charge

Issue credit and debit notes referencing the original, and self-assess tax on imported services.

### Withholding tax

Compute and issue certificates, with an e-filing file that uses Thai date and encoding conventions.

### Income-tax provision

Compute from pretax profit with permanent and temporary adjustments, reconciling the effective tax rate by construction.

TAX & COMPLIANCE · continued

# File with the Revenue Department directly, with no format fixes

### Controls & segregation of duties

**TAX-07** — Credit and debit notes pass maker-checker approval before entering the return.

**TAX-06** / TAX-11 — Tax provisioning requires a distinct runner and poster.

**TAX-04** — The VAT return reconciles to the ledger before filing.

**TAX-01** — Tax rates come from per-country configuration, with none hard-coded.

### Where it stands out

Standards-based e-Tax invoices with a digital signature and embedded file, genuinely fileable and durable even if a provider fails.

Complete Thai tax coverage — VAT, reverse charge, specific business tax and withholding — all reconciled to the ledger.

E-filing files use Thai date and encoding conventions, so they file without editing.

The income-tax provision with an effective-rate reconciliation works together with the deferred-tax book.

**Key screens** /tax/invoices /tax/wht /tax/reports /tax/provision /einvoice

TREASURY & FINANCIAL INSTRUMENTS

# A liquidity and financial-instruments control centre to international standards

**Role** It brings together front-of-house cash handling, bank deposits, bank reconciliation and a cash-command board with a thirteen-week forecast, plus an IFRS 9 financial-instruments register covering debt, investments, hedge accounting and cash pooling.

### Cash handling & deposits

Open and close tills with variance reconciliation, and batch bank deposits, surfacing undeposited-cash exposure.

### Bank reconciliation

Import statements and match with a shared engine, holding fee entries as drafts until another person approves.

### Cash-command board

Show the cash position, a thirteen-week forecast, the liquidity trough and FX exposure on one screen.

### Debt & borrowings

Manage facilities, drawdowns and effective-interest accrual, tracking covenants and breaches.

### Investments

Classify per the standard, with approved market prices, splitting gains into other comprehensive income or profit or loss.

### Hedge accounting

Designate relationships and test effectiveness, deferring OCI accounting until approved and effective.

TREASURY & FINANCIAL INSTRUMENTS · continued

# A financial-instruments register complete to IFRS 9

### Controls & segregation of duties

**TRE-01** to TRE-05 — Every financial instrument requires a distinct creator and approver.

**REC-02** — Bank reconciliation requires a distinct preparer and certifier.

R23 — Treasury duties are segregated from approval authority.

G9 — Creating a bank account requires approval before use.

### Where it stands out

A financial-instruments register complete to IFRS 9 — debt, investments, hedging and cash pooling.

One matching engine serves both bank reconciliation and store-level PromptPay reconciliation.

A thirteen-week cash forecast, the liquidity trough and FX exposure sit on one screen.

Intercompany loans and interest eliminate on consolidation, so the group nets finance cost and income to zero.

**Key screens** /finance/treasury /bank /reconciliation /cash-banking /financial-health

HUMAN CAPITAL MANAGEMENT

# End-to-end people management on a single employee record

**Role** A human-capital suite built on one employee record, covering org structure, recruiting, onboarding and offboarding, compensation, training, appraisals and employee self-service. Every approval separates the approver from the subject, and every table is isolated by company.

### Org structure & positions

Organise departments and budgeted positions, with an org chart showing filled versus approved headcount.

### Recruiting & hiring

Manage requisitions, a candidate pool and offers, where hiring converts an approved offer into a real employee.

### Onboarding & offboarding

Use reusable checklists, with an access-revocation gate when an employee leaves.

### Compensation & benefits

Manage pay bands by grade, where compensation changes must stay within band and require a second approver.

### Training & certifications

Run courses and track certifications with expiry, with a detective compliance report.

### Employee self-service

Employees maintain their own data, with sensitive fields held for HR approval and contact details applied instantly.

HUMAN CAPITAL MANAGEMENT · continued

# Headcount cannot be exceeded from the inside

### Controls & segregation of duties

**HR-01** — Filling beyond approved headcount is blocked, and an override requires executive approval and is logged.

**HR-05** — Offboarding cannot complete until access revocation is finished.

**HR-06** — Compensation changes must stay within band and require a second approver.

**HR-08** — Changing an employee's sensitive fields requires HR approval.

### Where it stands out

Headcount cannot be exceeded from the inside; every over-establishment hire is an attributable executive decision.

The offboarding gate is a genuine control: a leaver's access must be provably removed before the case closes.

Certifications are minted with an expiry automatically, so a lapse cannot be missed.

Employees cannot silently repoint their own pay; it must pass independent HR approval.

**Key screens** /hcm/org /hcm/recruiting /hcm/onboarding /hcm/comp /hcm/training /hcm/ess

PAYROLL & TIME

# Thai-statutory payroll under maker-checker control

### ฿ Thai payroll engine

**Gross-to-net** Compute social security, progressive income tax and provident fund, unit-tested with no ad-hoc rates.

**Statutory filings** Produce monthly and annual withholding returns, with a liability schedule reconciled to the ledger.

**Payslips** Generate printable, sendable payslips that mask the citizen ID and restrict access under data-protection rules.

**High-volume processing** Process large populations off the request thread, idempotent per company and period.

### Control & time

**Cannot pay yourself** A payroll run posts as an excluded draft, and self-approval is rejected even for the administrator.

**Overtime rules** Tiered overtime rates aligned to labour law, with labour-to-sales alerting.

**Anti buddy-punch** Capture clock-in by PIN, QR or face, blocking duplicate punches and flagging location.

**Ties to ledger and filings** The liability schedule reconciles the ledger accrual against an independent payrun total.

PROJECT & PORTFOLIO MANAGEMENT

## Enterprise project management with end-to-end material control

**Role** A project and portfolio platform on the projects-and-pipeline spine, from converting a won opportunity into a project, through work breakdown and Gantt charts, rate cards, earned-value analysis, baselines and risk registers, to a real-time action centre and a construction material-control loop that genuinely enforces budgets.

### Portfolio command centre

Show project health via cost and schedule indices, contract value, billings, work-in-process and a forward forecast.

### Action centre

Rank what needs attention by severity and alert the moment a project drifts, over a real-time channel.

### Resources & capacity

Manage effective-dated rate cards, a capacity calendar and skill supply-versus-demand.

### Earned value & schedule

Compute cost and schedule indices, earned schedule and the critical path, with dependencies and lags.

### Baselines, RACI & risk

Control baseline changes, maintain a responsibility matrix and a risk register that surfaces unmitigated high risks.

### Material control & project buying

Approve the bill of quantities via maker-checker, reserve budget under row-level locking, and issue materials into project work-in-process.

PROJECT & PORTFOLIO MANAGEMENT · continued

# Budgets that are genuinely enforced and concurrency-safe

### Controls & segregation of duties

**PROJ-04** — Timesheets posted as labour cost require an approver other than the person who logged them.

**PROJ-12** — Purchase orders tied to a budget line reserve budget under row-level locking and cannot exceed it.

**PROJ-13** — Over-budget material requisitions route to an authoriser other than the requester.

**PROJ-08** — Unmitigated high risks surface in a detective action centre.

### Where it stands out

The action centre pushes exceptions in real time; a project going red or a risk left unmitigated wakes the inbox at once.

Budget enforcement is concurrency-safe; locking a line stops two simultaneous orders from jointly overrunning.

Earned schedule keeps flagging slippage honestly late in a project, where the ordinary index tends to mislead.

Project buying goes through a shop that shows only approved budget lines, so site staff cannot order off-budget.

**Key screens** /projects/portfolio /projects/action-center /projects/{code} /projects/resources /shop/project/{code}

REAL ESTATE & CONSTRUCTION [VERTICAL]

# From tender to title transfer, with correct Thai construction tax

**Role** A purpose-built solution for contractors and property developers on the project, procurement and finance spine, covering pre-award tendering, progress billing with retention, subcontractor management, and property sales from booking through the sale contract and instalments to title transfer, with correct revenue recognition.

### Units & availability

Manage units with a status from available to reserved, contracted and transferred, where a unit cannot be double-sold.

### Tendering & award

Build a priced bid with markup, track its status, and on winning spin up a project and draft bill of quantities in one click.

### Progress billing

Value work by line, cumulatively, billing only the movement, with output VAT and retention withheld.

### Subcontractor management

Register commitments against the bill of quantities, certify work in valuations, and withhold retention and construction withholding tax.

### Sale contracts & approval

A draft contract posts nothing until an independent approver certifies it, which flips the unit status and books the deposit.

### Instalments & title transfer

Receive each instalment exactly once, and recognise revenue on title transfer after full settlement.

REAL ESTATE & CONSTRUCTION · continued

# Correct Thai construction tax, end to end

### Controls & segregation of duties

**RE-02** — A sale contract must be certified by an independent approver other than its preparer.

**PROJ-16** — Progress claims are certified by a certifier separate from the person who raised them.

**PROJ-17** — Subcontractor valuations are certified by an independent certifier.

**RE-01** — Unit integrity is re-checked at contract approval, so a unit cannot be double-sold.

### Where it stands out

A winning bid becomes the project budget in one click, so bidding and delivery share one baseline.

Correct Thai construction tax throughout — output VAT on progress claims, input and withholding tax on subcontracts, and retention.

Progress billing cannot over-certify: cumulative line valuation, capped at one hundred percent, with an independent certifier.

A unit cannot be double-sold; cash sits in a contract liability, and no revenue is recognised until title transfers.

**Key screens** /projects/tenders /projects/billing /projects/subcontracts /realestate

PLANNING, BUDGETING & DEMAND

# Budgets you can enforce and forecasts you can explain

**Role** A full financial-planning layer — maker-checker budgets, driver-based plans, three-way variance analysis, a budgetary-control gate enforced on procurement, explainable demand forecasting and segment-profitability allocation — where variance is a detective control over the posted ledger.

### Budgets

Build budgets by account, period and cost centre, where an unapproved budget is excluded from variance.

### Budget versus actual

Use actuals from posted entries only, flagging material variances with a management review sign-off.

### Budgetary control

Set a policy that checks budget availability at requisition approval, where exceeding it requires a reason and executive approval.

### Driver-based plans

Maintain plan versions and scenarios, with forecasts computed from ledger actuals.

### Demand forecasting

Use several explainable statistical models, including the Thai holiday calendar and weather, selecting the most accurate by back-testing.

### Profitability allocation

Define segments and allocation rules, then report profitability by segment.

PLANNING, BUDGETING & DEMAND · continued

# Budgets that are actually enforced, not merely reported

### Controls & segregation of duties

**BUD-01** — Budgets require a distinct preparer and approver, and an unapproved budget is excluded from variance.

**BUD-02** — The budget gate blocks over-budget requisitions, where an override comes from an executive with a reason.

**ELC-06** — Material variances require a review sign-off with a retained follow-up note.

**EPM-04** — Actuals used in analysis come from the posted ledger only.

### Where it stands out

Switch the policy from reporting to enforcement, and over-budget requisitions are stopped at approval, requiring an executive override.

A self-serving budget cannot hide overspend, because an unapproved budget is excluded and self-approval is impossible.

Demand forecasting uses transparent, explainable statistics — including Thai holidays and weather — not a black box.

Variance review is retained as evidence: material variances require a signed follow-up note.

**Key screens** /budget /demand /planning /profitability

BUSINESS INTELLIGENCE & ANALYTICS

# Every metric drills down to the ledger

**Role** A governed analytics layer that turns the ledger and sales into metrics, reports and forecasts, where every figure reconciles to its source, is cached per company for speed, and can be self-served, scheduled or streamed in real time — from a one-line KPI board to a finance command centre and a no-code query builder.

### KPI boards & cubes

Show sales, open receivables and payables and pipeline, with a sales cube you can drill into.

### Finance command centre

Bring together dozens of finance metrics with rating and comparatives, where a red metric drills to its ledger rows.

### Query & natural language

Use a predefined semantic layer, so user input never reaches raw database commands, and ask in Thai or English.

### Scheduled reports

Subscribe to reports by frequency and channel, with the system generating, delivering and logging every run.

### Live streaming dashboards

Update metrics in real time with a connection indicator, falling back to polling when needed.

### Insights & forecasting

Detect anomalies, recommend replenishment and provide menu-engineering analysis for restaurants.

BUSINESS INTELLIGENCE & ANALYTICS · continued

## The number you review is the number everywhere

### Controls & segregation of duties

**BI-01** — Every report reconciles to its source, for completeness and accuracy of information produced.

**BI-04** — Forecasting and the AI assistant are confined to a read-only, advisory boundary.

**ELC-07** — Management review of analytical metrics is an entity-level control.

R01 — Every endpoint passes permission checks and per-company data isolation.

### Where it stands out

Every metric drills to the ledger, and one definition feeds the dashboard, the scheduled pack and the executive board.

A natural-language question resolves to a governed query, not raw database commands, so free text cannot cross companies.

Demand forecasting self-selects the best model and learns the effect of Thai holidays and weather, while remaining explainable.

Live dashboards degrade gracefully — streaming with a polling fallback and a connection indicator.

**Key screens** /finance/command-center /query /nl-analytics /insights /scheduled-reports

ARTIFICIAL INTELLIGENCE

## An AI that shares the app's code path and cannot touch the ledger directly

**Role** An assistant layer wired directly onto the same service layer the application uses, so it inherits permissions and company scope automatically and can only read, suggest or file a proposal a human must approve. It runs even without an external service key and redacts personal data before any outbound call.

### Assistant & copilot

Answer in natural language from live company data, and respond only from the company's documents with citations, or decline.

### Approve-then-execute actions

The AI proposes a journal entry or purchase order to a queue, which a different authorised person must approve before it runs.

### Document intake

Turn invoice text into a structured payables draft, which a human posts through the normal cycle.

### PII redaction

Mask email, phone, citizen ID and address before anything reaches an external model.

### Config & NL analytics

Describe a field, rule or automation in plain language and receive a config draft to review before applying.

### AI spend governance

Set usage caps per company and track cross-company spend from the platform console.

ARTIFICIAL INTELLIGENCE · continued

# The AI sees and does only what the user can

### Controls & segregation of duties

**BI-04** — The AI is confined to a read-only, advisory boundary and does not post to the ledger directly.

SoD — Actions the AI proposes must be approved by a different person.

**AIG-01** to AIG-04 — Automated accuracy tests, a data-protection gate and honest labelling are in place.

PDPA — Personal data is redacted before egress, and a company can opt out.

### Where it stands out

The AI shares the app's code path with no separate un-authorised surface, so it sees and does only what the user can.

Propose, approve, then execute, behind a firm segregation wall: the model can draft, but a different authorised person must approve.

It answers only from the company's documents with citations, or declines — it does not fabricate policy.

It runs even offline, with automated accuracy testing and data redaction before egress.

**Key screens** /assistant /copilot /ai-actions /doc-ai /nl-analytics

NO-CODE CUSTOMISATION STUDIO

# Shape the system to your business without writing code

**Role** A no-code toolkit that lets each company adapt the system to its business without a developer, covering custom fields and objects, form layouts, approval, alert and automation builders, document templates, brand themes and menu control — all isolated by company and posting nothing to the ledger.

### Custom fields & objects

Add typed fields to any entity and create new record types without a shipped module.

### Form layouts & views

Arrange sections and columns by role against live fields, so new fields appear automatically and stale references drop.

### Approvals, alerts & automation

Build multi-level approvals, alert rules and when-then automations, none of which touch the ledger.

### Document templates

Design receipts, quotes, purchase orders and tax invoices, without altering amounts or removing mandatory fields.

### Brand theme & menu control

Adjust colours and logo across the app, and hide or disable modules per company without affecting others.

### Configuration assistant

Describe the configuration you want in plain language and receive a ready-to-apply draft after review.

NO-CODE CUSTOMISATION STUDIO · continued

# Freely customisable, yet auditor-safe by design

### Controls & segregation of duties

ITGC-AC-03 — Every customisation is isolated by company through row-level security.

ITGC-AC-10 — Every change is recorded in an append-only audit trail.

**MDM-02** — Bulk imports pass validation.

By design — no customisation feature affects the ledger, and least privilege applies.

### Where it stands out

Build an entire application of your own without code — define the object, its fields, a role-based layout and capture records.

Document templates are auditor-safe by design: restyle a tax invoice, yet mandatory fields are retained and amounts cannot change.

Tailor menus and modules per company — hide, reorder and disable — without affecting other companies.

The AI can draft configuration: describe it in plain language and receive a ready-to-apply proposal.

**Key screens** /custom-fields /custom-objects /object-layouts /workflow /automation /document-templates

PLATFORM & ECOSYSTEM

# Multi-company operations, integrations and a customer portal

A multi-company control plane with an integration suite and a customer portal, where provisioning is reserved for the platform owner and every part is isolated by company.

### Platform console

**Provision, suspend and act on behalf of a company, with cross-company business metrics and a verifiable audit trail.**

teal

### Atomic provisioning

**Create the company, administrator, trial, fiscal periods and industry chart of accounts in one transaction, ready to post immediately.**

teal

### Read-only impersonation

**The platform owner can inspect any company with mutations blocked, and every action is logged.**

cyan

### Public API & developer portal

**Expose a scope-gated, rate-limited API isolated by company, with auto-generated standard documentation.**

violet

### Webhooks, SSO & connectors

**Deliver signed webhooks, support enterprise sign-on, and stage connector data for review before posting.**

violet

### Customer portal

**Give a dashboard, sales, stock with auto-reorder, order tracking and loyalty, cleanly separated from the back office.**

gold

6

SECTION

# Further considerations

Adoption, architecture, packaging, support and the path forward together.

FURTHER · 6.1

## Adoption and onboarding

Designed for a fast start, with atomic company provisioning and built-in data migration.

**Provisioned in one step** company, administrator, trial, fiscal periods and an industry chart of accounts in one transaction, ready to post.

**Industry chart templates** templates for restaurant, retail, distribution and services, ready from day one.

**Controlled data migration** import and export every entity, with dry-run validation, preview and commit.

**Controlled opening balances** go-live balances pass the same maker-checker as any other entry.

**Three ways to onboard** direct create, a single-use invite, or a request queue, with public self-signup disabled in production.

**Documentation as part of the work** process narratives, user manuals and test documents are updated alongside the system.

FURTHER · 6.2

## Architecture, reliability and operations

**A modern stack**
built on a modern server and web framework with a multi-company database.

**Tested backup and restore**
automated backups with a genuinely tested restore procedure.

**A continuity plan with targets**
a disaster-recovery and business-continuity plan with time and data targets.

**Monitoring and alerting**
always-on signals, with failed-job alerting and stuck-job recovery.

**Rigorous quality gates**
type checks, build, control tests and output comparison before every merge.

**Safe to repeat by design**
repeating a posting has no double effect, and every multi-table change is one transaction.

FURTHER · 6.3

## Packaging and flexibility

The system is genuinely modular — enable or disable modules, adjust surfaces and set branding per company.

**Per-company module control** enable or disable whole modules per company without affecting others.

**Industry packs** enable only what is needed — construction and real estate, or restaurant.

**White-label branding** adjust colours, logo and document templates across the app, per company.

**Built-in SaaS metrics** track recurring revenue, growth and churn, for operators who resell.

FURTHER · 6.4

## Ecosystem and integration

**Public API & developer portal**
a scope-gated, rate-limited API isolated by company, with standard documentation.

**Signed webhooks**
deliver signed events within a time window, with secrets stored encrypted.

**Enterprise sign-on**
support federated sign-on and user lifecycle, deactivating leavers rather than deleting them.

**Messaging channels**
integrate LINE, email and SMS for alerts, reports and marketing.

**Delivery marketplaces**
receive orders from leading delivery platforms, with menu sync and auto-pause.

**Localisation packs**
support per-country charts, tax and language, with e-invoicing adapters.

FURTHER · 6.5

## Documentation, support and quality

Documentation is a first-class deliverable, prepared for standards audit and real-world use.

**Process narratives per cycle** in a standard format, with workflow diagrams, control matrices and revision history.

**User manuals per module** covering steps, required permissions, control points and frequently asked questions.

**Test and traceability documents** positive and control test cases, linked to control identifiers.

**Honest control-status reporting** stating plainly that implementation is not external attestation — transparent to auditors.

**Bilingual throughout** the interface and documentation support both Thai and English.

**An in-app control centre** auditors can browse the control inventory and evidence inside the product.

FURTHER · 6.6

## Strategic readiness

Invisible ERP is more than an operating system — it is a strategic asset for growth and capital raising.

**4**
**standards supporte d**
from a single evidence base

**3**
**parallel accounting bases**
post once, report under several

**98%**
**of controls tested**
by continuous automated testing

**0**
**open control gaps**
in the current control register

Strong internal control from the outset lowers remediation cost, speeds audit and adds enterprise value.

FURTHER · 6.7

## Six reasons finance leaders choose us

**Proof, not claims**
controls fully documented, mostly tested automatically, with no open gap.

**Isolation that fails safe**
database-level isolation that refuses to start if misconfigured.

**Externally reviewed**
external-review findings all closed, and penetration testing re-verified.

**A trail that survives erasure**
audit-trail integrity coexists with the right to erase personal data.

**One base, many standards**
one evidence base serves several standards, cutting compliance cost materially.

**Honest by design**
a guard forbids overstatement — what auditors trust most.

FURTHER · 6.8

## In summary

Invisible ERP is the one platform that unites operations, finance and public-company internal control, for Thai businesses set on durable growth.

**Complete** point of sale, back office, CRM, loyalty and a customer portal on one data-and-permission spine.

**Rigorously controlled** maker-checker enforced even against the administrator, segregation of duties and an immutable trail.

**Genuinely Thai-compliant** signed e-Tax invoices, complete returns, PromptPay and LINE.

**To international standards** revenue, leases, financial instruments, multi-GAAP and cross-currency consolidation.

**Intelligent and adaptable** an AI fenced from the ledger, analytics that drill to it, and no-code customisation.
