Invisible ERP

Sales Kit

The complete field guide for selling the audit-grade, omnichannel ERP for food & beverage enterprises — pitches, product detail, personas, battlecards, objection handling, demo script, and ROI math.

Pitch-ready in 10 seconds

Compliance answers for procurement

15-minute demo script

INTERNAL SALES ENABLEMENT · V1.0 · CONFIDENTIAL — DO NOT DISTRIBUTE

SECTION 1 · ORIENTATION

How to use this kit

First call in 5 minutes?

Read §2 (pitches) and §5 (personas). Open with the 30-second pitch matched to the persona in the room.

Facing a competitor?

Refer to §7 (battlecards) for the key winning arguments and §8 for the objections that typically follow.

Demo booked?

§10 (discovery) before the call, §11 (demo script) during, §12 (ROI levers) to close the follow-up.

The key point to remember: every competitor makes the customer choose between running the restaurant and controlling the money — **Invisible ERP is the only platform where the diner's QR scan and the auditor's journal entry are the same record.**

SECTION 2 · MESSAGING

Elevator pitches & positioning

10 SECONDS — THE HOOK

"Invisible ERP runs your entire restaurant business — POS, kitchen, stock, purchasing, and accounting — on one system, so every sale lands in an audit-ready ledger the moment it happens."

30 SECONDS — THE ELEVATOR

"F&B chains today run a POS from one vendor, delivery tablets from three more, spreadsheets for stock, and an accounting package that sees everything a month late. Invisible ERP replaces that patchwork with one Thai-localized, multi-tenant platform: diner QR ordering, POS and KDS, warehouse and purchasing, manufacturing, HR, and a full general ledger with SOX-grade controls built in. Orders post to the ledger in real time, delivery and payment channels are integrated natively, and month-end closes in days, not weeks — with the evidence an auditor needs generated automatically."

2 MINUTES — THE STORY

"Think about what happens when a diner scans the QR code on table 12. In most chains that order touches five systems that don't talk: the ordering app, the POS, the kitchen printer, a stock spreadsheet someone updates on Sunday, and an accounting system that gets a summary import next month. Every hand-off is a place where money leaks — miscounted stock, unreconciled delivery fees, journal entries no one can explain.

Invisible ERP was built so that scan IS the system of record. The order hits the kitchen display, the sale posts to the general ledger with the right VAT treatment, ingredients deplete from stock by recipe, and the delivery-platform settlement reconciles against it automatically. Around that spine we built everything a growing chain needs — purchasing with blind-count receiving, central-kitchen manufacturing, projects, HR and payroll, CRM and loyalty — all sharing one permission model with 82 granular permissions and 26 segregation-of-duty rules, on true multi-tenant infrastructure isolated at the database row level.

That's why our customers can pass a SOX-style audit with evidence the platform produces itself — and why a chain preparing for investment, franchise expansion, or a listing chooses us over a POS that can't do accounting or an ERP that can't run a restaurant."

Positioning statement: For mid-market F&B chains (5–100 branches) that have outgrown POS-plus-spreadsheets, Invisible ERP is the omnichannel restaurant ERP that delivers audit-grade financial control in real time — unlike legacy ERP suites that take years to deploy and still can't run a restaurant floor.

The platform at a glance

1	24 / 82 / 26	2	9+
REAL-TIME AUDITED LEDGER	ROLES / PERMISSIONS / SOD RULES	LANGUAGES — THAI & ENGLISH	NATIVE CHANNEL & SERVICE INTEGRATIONS

Architecture in one paragraph

A modern TypeScript stack end-to-end: a **Next.js 15** web app (desktop, tablet, and phone layouts), a **NestJS/Fastify** API, and **PostgreSQL** with row-level security so every tenant's data is isolated by the database itself, not just by application code. Everything — POS sale, goods receipt, payroll run, lease schedule — posts through one ledger service with maker-checker approval, so operations and accounting can never drift apart. The platform is multi-company by design: a franchise group or holding company runs its whole fleet from one console, with per-company isolation and cross-company reporting.

Integration surface

CATEGORY	WHAT'S INTEGRATED	HOW IT'S SECURED
Payments	3 payment gateways (cards, QR payment, e-wallets)	Signed webhooks, replay-window protection
Delivery & marketplaces	3 delivery/marketplace channels — orders flow into POS/KDS	HMAC-verified inbound, per-channel secrets
Tax	Thai e-Tax invoicing, VAT & withholding document flows	Numbered tax documents, immutable audit trail
Front of house	POS terminals, kitchen display (KDS), diner QR ordering, customer display	Session + device-level auth
Identity	Enterprise SSO and SCIM auto-provisioning	IdP-driven joiner/mover/leaver
Chat & capture	Chat order capture, web-to-lead	HMAC-verified inbound webhooks
Open API	Scoped API keys for custom integrations	Keys bounded to the issuer's own permissions

Module catalog — what you're actually selling

Front of house & revenue

POS, KDS & dine-in

- Table service, takeaway, and counter sale on the same register; phone-optimized layouts for handhelds
- Kitchen Display System with station routing, SLA timers, bump/recall, and expo view
- Split bill, merged checks, tips distribution, shift and cash-drawer management
- Returns, even/partial exchanges netted through store credit, and gift cards — all reason-coded and permission-gated

Why buyers care: every front-of-house action posts correct GL entries automatically — no end-of-day summary imports, no leakage

Diner QR ordering & customer portal

- Scan-to-order at the table with a public menu — no app install
- Customer portal for members: order history, points, e-receipts
- Pole/customer display for order status in-store

Why buyers care: adds capacity without headcount and captures every diner as a CRM member

Omnichannel & delivery

- Orders from 3 delivery/marketplace channels land directly in the KDS queue
- Channel settlements reconcile against recorded orders — commissions and fees itemized
- Chat-based order capture for social-commerce sales

Why buyers care: eliminates the separate delivery-tablet setup and allows delivery revenue to reconcile automatically

CRM, loyalty & growth

- Member profiles, tiered points, campaigns, and audience segments
- Sales pipeline with win/loss tracking; won deals convert into delivery projects
- PDPA-compliant audience egress controls for ad platforms

Why buyers care: turns transaction data into repeat visits while staying on the right side of PDPA

Supply chain & production

Inventory & WMS

- Real-time stock by branch and location; barcode scanning throughout
- Putaway, picking, replenishment, stock reservations, and stocktakes
- Recipe/BOM-driven depletion from POS sales — theoretical vs. actual variance

Why buyers care: shrinkage becomes visible per branch, per day, rather than surfacing as a quarterly surprise

Procurement

- Requisition → approval → PO → receiving with budget checks along the way
- Blind-count goods receiving: counters never see the ordered quantity; over-receipt tolerance only for weighed goods
- Time-boxed claims with dock-photo evidence; three-way match places AP payment holds automatically
- RFQs, supplier screening & scorecards, price lists, and maker-checker on vendor bank-detail changes

Why buyers care: closes the receiving and vendor-fraud control gaps that auditors and owners are most concerned about

Manufacturing & central kitchen

- Multi-level BOMs, routings, work centers, and shop-floor operations
- MRP and rough-cut capacity planning generate purchase suggestions
- Finite-capacity scheduling (APS); QC disposition with controlled scrap write-offs

Why buyers care: central-kitchen chains get factory-grade planning without a separate MES

Projects, PPM & real estate

- WBS, Gantt, milestones, EVM, baselines, RACI, risks and issues
- Timesheets with maker-checker labor posting; rate cards; BoQ-driven material control
- Subcontract valuations with free-issue material custody tracking; PMO action center
- Real-estate module for property/space management

Why buyers care: expansion projects (new branches, fit-outs) run on the same controlled ledger as operations

Finance & governance

General ledger & close

- Real-time posting from every module; manual JEs are draft-until-approved (maker-checker)
- Recurring journals, prepaid amortization, multi-currency AR/AP statements
- Close Manager: a period-close checklist that auto-completes only on system evidence (bank recs certified, depreciation posted, FX revalued)
- Cash-flow statements (direct, indirect, forecast), budget vs. actual, year-end close

Why buyers care: month-end drops from weeks to days because the evidence is produced, not hunted

Tax & e-Tax (Thai)

- VAT documents, withholding certificates, numbered tax document series
- e-Tax invoice generation and submission flows

Why buyers care: Thai tax compliance is native, not a bolted-on localization pack

Assets, leases & treasury

- Fixed assets: depreciation, revaluation, impairment, disposal; EAM work orders and preventive maintenance
- IFRS 16 leases: right-of-use assets, liability schedules, modifications
- Collections and dunning workflows, credit holds, petty-cash advances

Why buyers care: the balance-sheet items that break audits elsewhere are first-class modules here

BI & analytics

- Live KPI dashboards streamed in real time; exec scorecards
- Scheduled report packs (governance, variance, supplier scorecards) delivered automatically

Why buyers care: management sees the current day's figures the same day, and board reporting packs are assembled automatically

People & platform

HR, payroll & ESS

- Payroll with GL posting; compensation, performance, recruiting, onboarding, and training modules
- Employee self-service: leave requests and balances, own-data access only

Why buyers care: one staff record from hiring to payroll to the P&L

Administration & controls

- 24 roles, 82 granular permissions, 26 segregation-of-duty rules enforced at grant time
- Approval center aggregating every maker-checker queue in one inbox
- Full audit trail; access recertification; quality/NCR management

Why buyers care: the control environment IS the product — not a report written after the fact

Multi-company platform

- Run an entire fleet of companies from one console: provisioning, plans, suspension, cross-company audit
- Company-scoped admins; platform owner sees fleet health, AI spend, and onboarding pipeline
- Per-company subscription billing with trials and AI usage metering built in

Why buyers care: franchisors and holding groups get SaaS-style fleet operations out of the box

AI & automation

- AI-assisted features metered per company with transparent token usage and overage billing
- Scheduled automations: dunning runs, PM work-order generation, recurring journals, lease runs — all idempotent

Why buyers care: automation that finance can trust: every run is idempotent and leaves an audit trail

Ideal customer profile & buyer personas

ICP: Thai (and expanding SEA) F&B operators with **5–100 branches** — restaurant chains, cafés, cloud/central kitchens, franchise groups — with formalizing finance needs: outside investors, bank covenants, franchise reporting, or listing ambitions. The primary target is the chain that has just hired its first dedicated CFO. Secondary: multi-concept holding groups and franchisors who need fleet-level consolidation.

The CFO / Finance Director

Economic buyer — owns the budget

THEIR PAINS

- Month-end close takes two to three weeks of manual spreadsheet reconciliation
- Can't produce audit evidence without a consulting project
- Fears fraud in purchasing and cash handling at branches
- Board/investors ask questions the systems can't answer

YOUR TALK TRACK

Lead with the Close Manager and maker-checker controls. Show a journal entry born from a POS sale, then the close checklist auto-completing on real evidence. Close with: 'your next audit's evidence pack is a by-product of daily operations.'

The COO / Operations Director

Champion — experiences the operational pain daily

THEIR PAINS

- Stock variance and shrinkage invisible until stocktake day
- Delivery tablets and channel reconciliation eat manager hours
- Every branch runs slightly different processes

YOUR TALK TRACK

Lead with blind-count receiving and recipe-based depletion. Show the KDS absorbing a delivery-channel order next to a QR dine-in order. Close with: 'one process, every branch, and variance you can see tomorrow morning.'

The IT / Systems Manager

Technical evaluator — holds veto power

THEIR PAINS

- Maintains a large portfolio of brittle point-to-point integrations
- User off-boarding is manual and risky
- Security questionnaires from partners are burdensome

YOUR TALK TRACK

Lead with the integration architecture (signed webhooks, one API surface), SSO/SCIM, and scoped API keys. Hand over §14 (security fact sheet) — it answers the questionnaire for them. Close with: 'you retire five integrations and one spreadsheet-import ritual.'

The Owner / CEO

Final approver — takes a long-term view

THEIR PAINS

- Wants to franchise, raise, or eventually list — and knows the books aren't ready
- Is aware of margin leakage but cannot locate its source
- Worried about betting on a vendor that's too small or too rigid

YOUR TALK TRACK

Lead with the growth story: the same platform runs 1 branch and 100 companies. Show the fleet console and the investor-grade control set (SOX-style ICFR readiness). Close with: 'the system your future auditors would have told you to buy.'

SECTION 6 · VALUE

Pain → capability → proof

CUSTOMER PAIN	PLATFORM CAPABILITY	PROOF POINT IN A DEMO
"We don't trust our stock numbers"	Blind-count receiving, recipe depletion, per-branch variance	Receive a PO without seeing ordered qty; watch variance report update
"Month-end takes three weeks"	Real-time GL posting + Close Manager with evidence-gated checklist	Open the close checklist; show items ticking only when evidence exists
"Delivery channels are chaos"	Native channel integration into KDS + settlement reconciliation	A channel order appears on KDS beside dine-in orders, fees itemized
"Purchasing feels leaky"	Budget-checked PRs, 3-way match with auto payment holds, vendor-bank maker-checker	Show an invoice blocked by a quantity mismatch hold
"Audits are expensive projects"	26 SoD rules, maker-checker everywhere, immutable audit trail, access recertification	Try to approve your own journal entry — the system refuses
"Systems don't speak Thai / Thai tax"	Full Thai + English UI, e-Tax, VAT & withholding flows	Switch language live; open a generated e-Tax document
"We're scaling and tools keep breaking"	Multi-company fleet console, SSO/SCIM, per-company billing	Provision a new company in minutes from the console

Battlecards

vs. Legacy mid-market ERP suites

(big-brand ERP with restaurant bolt-ons)

WHEN YOU MEET THEM

Enterprise-leaning prospects who equate brand size with safety; consultants are often part of the evaluation.

WHY WE WIN

Deployment in weeks vs. 12–24 months; F&B operations (KDS, QR, recipes, delivery) are native, not a partner add-on; controls are built-in rather than a compliance consulting project; TCO has no per-module license maze or integrator dependency.

WHERE THEY ARE STRONG — ACKNOWLEDGE HONESTLY

Deep multi-country consolidation, treasury depth for conglomerates, and huge partner ecosystems. If the prospect is a 500-branch multinational, apply strict qualification.

Strategic question to leave with the customer: "Invite the customer to request a fixed-price quotation for posting a diner's QR order to the general ledger in real time — inclusive of the integrator's fees and delivery timeline."

vs. POS point solutions

(modern cloud POS with basic stock features)

WHEN YOU MEET THEM

Chains already running a popular POS that plan to add accounting capability at a later stage.

WHY WE WIN

A POS has no general ledger, no purchasing controls, no payroll, no close — in practice, 'later' means CSV exports into an accounting package supported by a manual re-keying team. We provide equivalent front-of-house speed together with the complete back office. Their stock module counts items; ours enforces blind counts, budget checks, and three-way match.

WHERE THEY ARE STRONG — ACKNOWLEDGE HONESTLY

Pure POS UX polish and hardware ecosystems; very small single-store operators are genuinely better served by them. Qualify out below roughly five branches unless growth is funded.

Strategic question to leave with the customer: "Invite the customer to ask how the system would prevent a branch manager from receiving 8 kg against a 10 kg purchase order and diverting the difference — and where that variance would appear in the P&L."

vs. Spreadsheets + custom scripts + local accounting software

(the status quo)

WHEN YOU MEET THEM

Owner-operated chains where an operations manager has built an internal spreadsheet system; typically cost-sensitive.

WHY WE WIN

The internally built spreadsheet system depends on a single individual, has no permission model and no audit trail, and — once staff hours are counted — already costs more than the software. We import their master data via built-in Excel/CSV import-export, so migration is days, not a project. Trials and per-company pricing de-risk the start.

WHERE THEY ARE STRONG — ACKNOWLEDGE HONESTLY

Zero perceived cost and infinite perceived flexibility. Avoid criticizing the spreadsheet's author — enlist them as an ally; they typically become the strongest power user.

Strategic question to leave with the customer: "Invite the customer to consider how month-end close would proceed if the owner of the master spreadsheet resigned unexpectedly during a holiday period."

Objection handling

"It's too expensive compared to our POS subscription."

Compare it to the full stack it replaces: POS + inventory tool + accounting package + the payroll spreadsheet + the person re-keying between them. Then add one recovered point of shrinkage — on most chains' COGS that alone exceeds the subscription. We'll build that math together in the ROI worksheet (§12).

"Migration sounds painful — we have years of data."

Master data (items, vendors, customers, chart of accounts) imports through built-in Excel/CSV templates with validation — typically days. Historical transactions stay in the old system for reference; you start the new ledger from an opening balance, which is exactly how auditors prefer a cutover. We run one parallel month-end before switching off the old close.

"Our staff aren't technical — they'll never learn a new system."

The register, KDS, and receiving screens are deliberately simpler than what they replace — phone-first layouts, big touch targets, Thai-first UI. Blind receiving is one number pad. The complexity lives in the back office where your accountants live, and they get a full Thai user manual and UAT scripts per module.

"We already customized our current setup — you won't fit our process."

Roles and permissions (82 of them), approval chains, posting rules, document numbering, and report packs are all configurable. What we deliberately do not permit is disabling financial controls — if a customization request amounts to allowing the same person to both order and approve, that is precisely the control gap the platform is designed to close. In practice, most customization requests prove to be workarounds for capabilities the platform already provides.

"What if you go out of business? You're smaller than the big ERP vendors."

A fair question, and one we are happy to address contractually: data export is a standard feature (full Excel/CSV export per entity), not a point of leverage. The customer owns their data at all times. It is also worth weighing the alternative risk: a large suite's implementation partner withdrawing mid-project is precisely the failure mode this platform replaces.

"Is our data safe on a multi-tenant cloud?"

Isolation is enforced by the database itself — row-level security — not just application code, and the API refuses to start if that isolation could be bypassed. Add SSO/SCIM, scoped API keys, signed webhooks, full audit trails, and PDPA-aware data handling. Hand them §14; it's written for their security reviewer.

"We only need POS right now."

Start there — POS + inventory is a valid landing package and it's priced that way. The difference from buying a point POS is that when you're ready for purchasing controls or a real close, it's a permission change, not a migration. You never re-platform.

"Can it handle our franchise / multi-brand structure?"

That's the architecture, not an add-on: each company is an isolated tenant, the group runs a fleet console with cross-company reporting and per-company billing, and an org can share data across sister companies when — and only when — you configure it. Franchisors can provision a new franchisee company in minutes.

SECTION 9 · COMMERCIALS

Pricing & packaging guidance

Illustrative packaging — confirm current price list with sales ops before quoting.

PACKAGE	FOR WHOM	INCLUDES	PRICING SHAPE
Starter	5–15 branches landing from POS point tools	POS/KDS/QR, inventory & receiving, basic reports	Per branch / month, self-service trial
Growth	Chains formalizing finance	Starter + procurement, full GL & close, AR/AP, tax/e-Tax, HR & payroll, CRM/loyalty	Per company + per branch / month
Enterprise	Groups, franchisors, pre-IPO	Growth + multi-company console, SSO/SCIM, ICFR control pack, manufacturing, projects, priority support	Annual contract, fleet pricing
AI add-on	Any tier	AI-assisted features	Usage-metered tokens with monthly allowance + overage

Expansion motion

Land Starter at pilot branches → Growth at fiscal-year start (clean opening balances) → Enterprise when the group consolidates or SSO appears in a security review.

Discount discipline

Trade discounts for term length, case-study rights, or a referenceable go-live date — never for removing the onboarding package (it protects the deployment).

Trials

Self-service trial companies are real tenants — data created in trial carries into the paid plan, which is itself a closing argument.

Question bank

Operations

- How many branches today — and in 24 months?
- Walk me through an order from a delivery app: how many screens and re-keys before it's in your P&L?
- When did you last know your true stock variance per branch?
- Who counts goods at receiving, and do they see what was ordered?

Finance

- How many days is month-end close? Who touches which spreadsheets?
- Could the same person raise and approve a PO or JE today? Would you know?
- What did your last audit (or due-diligence) cost in fees and staff time?
- How do you produce VAT and withholding documents today?

Systems

- List every system a sale touches from order to ledger. Who maintains each hand-off?
- What happens to system access when someone resigns?
- Any security questionnaires from partners/banks you've struggled with?

Strategy

- Any plans for investment, franchising, or listing — on what horizon?
- What would you do with branch-level P&L by 9 a.m. daily?
- Who else feels this pain — who signs, who vetoes?

Qualify out when: single store with no funded growth; core need is multi-country consolidation for a conglomerate; or they want controls turned off "to keep things flexible".

SECTION 11 · DEMO

The 15-minute golden-path demo

Setup: demo company seeded with menu, recipes, stock, and one open PO. Two browser profiles logged in: a cashier and a finance manager — the permission difference IS the demo.

1 The scan (2 min)

SHOW Scan the table QR on your phone, order two items, watch them appear on the KDS by station.

SAY "This QR code encapsulates the entire value proposition. Please note what a single scan sets in motion."

2 Front of house (3 min)

SHOW Take a counter order on the register, split the bill, take one payment by QR payment. Bump the KDS tickets.

SAY "Your cashiers get a faster register than the POS they know — split bills, tips, returns, all permission-gated."

3 The invisible accountant (3 min)

SHOW Switch to the finance profile: open the GL entry created by the sale, then the stock movement it drove.

SAY "Nobody did any accounting just now — and yet: here's the journal entry, VAT split out, and the ingredients depleted by recipe."

4 Controls enforced in practice (3 min)

SHOW As the cashier, try to approve a journal entry / change a vendor bank account — show the refusals. As finance, receive the open PO blind and enter a short count; show the variance flag.

SAY "This is what auditors mean by segregation of duties — the system enforces it, not a policy PDF."

5 The close & the fleet (3 min)

SHOW Open Close Manager mid-period (some items green, some waiting). Then the multi-company console: branches, companies, live KPIs.

SAY "Month-end is a checklist that completes itself when the evidence exists. And this is one company of your future fleet."

6 Close the meeting (1 min)

SHOW Offer a trial company loaded with the customer's own master data via the import templates — and secure the working session before the meeting ends.

SAY "You saw one scan become an audited ledger entry with stock, tax, and controls attached. That's the whole product. What would you want to see with your own menu in it?"

SECTION 12 · ROI

Value levers & example math

Illustrative model for a 20-branch chain, ฿2.5M revenue/branch/month, 32% COGS. Replace with the customer's numbers in the discovery follow-up.

LEVER	MECHANISM	CONSERVATIVE ASSUMPTION	ANNUAL VALUE
Shrinkage & variance	Blind counts, recipe depletion, daily variance visibility	0.8% of COGS recovered	**฿1.5M**
Close & audit effort	Real-time ledger, evidence-gated close	Finance saves 25 person-days/mo + ฿0.8M audit-prep fees	**฿2.0M**
Channel reconciliation	Native delivery settlement matching	1 manager-hour/branch/day recovered	**฿1.8M**
Procurement leakage	3-way match holds, vendor-bank maker-checker, budget-gated PRs	0.5% of purchase spend	**฿1.0M**
Retired software & re-keying	One platform replaces 4–5 tools + manual imports	Current tools + 1 FTE	**฿1.2M**

Total illustrative value: **~฿7.5M/year** — against a platform subscription typically a fraction of that. Lead with shrinkage and close effort; these are the two levers the CFO will have experienced directly.

Implementation journey

PHASE	WEEKS	WHAT HAPPENS	CUSTOMER EFFORT
1 · Foundation	1–2	Company provisioning, chart of accounts, roles & permissions mapped to the org, master-data import (items, recipes, vendors, customers) via Excel/CSV templates	Data owners validate imports; 2 workshops
2 · Pilot branches	3–4	POS/KDS/QR live at 2–3 branches; receiving & stock counts running; daily variance reviews	Branch managers + trainers on-site days
3 · Back office on	5–8	Procurement chains, AR/AP, payroll, opening balances posted; first in-system month-end run in parallel with the old close	Finance team runs parallel close
4 · Fleet rollout	8–12	Remaining branches in waves; delivery channels & payment gateways switched over; old tools retired	Wave schedule owned jointly
5 · Controls hardening	12+	SoD review, access recertification cadence, close-checklist tuning, BI report packs, (Enterprise) SSO/SCIM	Quarterly control review, 2 hrs

Enablement included

Thai-language user manual per module, UAT scripts, and role-based training paths — the same artifacts our own QA runs.

Support

In-app help, Thai/English support desk, and a named onboarding lead through phase 4.

Success criteria

Agree them in the contract: first parallel close reconciled, variance reporting live, old POS retired by a named date.

SECTION 14 · TRUST

Security & compliance fact sheet

Hand this section to the customer's security or audit reviewer as-is.

DOMAIN	CONTROL
Tenant isolation	PostgreSQL row-level security on every tenant table; the API performs fail-closed boot checks and refuses to start if its database role could bypass isolation.
Access control	24 roles, 82 granular permissions, object-level authorization on every resource; 26 segregation-of-duty rules checked at grant time; periodic access recertification workflow.
Financial integrity	Maker-checker on journal entries, vendor bank-detail changes, tolerance changes, and privileged grants; idempotent posting (no duplicate ledger entries); immutable audit trail with actor, timestamp, and before/after values.
Identity	Enterprise SSO; SCIM provisioning for automated joiner/mover/leaver; MFA support; API keys are scoped and bounded to the issuing user's own permissions.
Integration security	Inbound webhooks HMAC-signed over the raw body with replay-window protection; outbound fetches pass an SSRF guard; per-request CSP nonce on the web app.
Data protection	PDPA-aware PII handling with redaction in logs; consent-aware audience egress controls; per-company data export available to the customer at any time.
Assurance process	Independent security reviews and penetration tests with tracked remediation; a documented Risk & Control Matrix (187 controls) with automated control tests executed in CI on every change; golden-master regression on financial outputs.
Operations	Rate limiting at the edge and public API; environment-based secrets management; least-privilege database roles in production.

FAQ

Does it work offline?

Front-of-house screens tolerate brief connectivity drops; the system of record is cloud-based. For sites with unreliable links we recommend a backup LTE route — raise persistent-offline requirements to solutions engineering during scoping.

Which languages are supported?

Thai and English, switchable per user, across the full product (~11,600 translated strings). The diner QR flow renders in both.

Can we keep our receipt printers / POS hardware?

The register runs in a browser on standard hardware; validate specific printer and drawer models during the pilot phase — bring the model list to scoping.

How are updates delivered?

Continuously, SaaS-style. Every change passes automated control tests, financial golden-master comparison, and migration gates before release — customers don't schedule upgrade projects.

Can auditors get their own access?

Yes — read-only, permission-scoped roles are standard; the audit trail and control evidence are first-class screens, not database extracts.

What's the data export story if we leave?

Full structured export (Excel/CSV) of master and transactional data per company, available to customer admins at any time. No exit fees for your own data.

Is there an API for our own developers?

Yes — a scoped public API with per-key permissions. Keys can never exceed the permissions of the person who issued them.

Which organizations are not a good fit?

Single independent restaurants with no growth plans, and multinational groups requiring multi-GAAP statutory consolidation across many countries — we prefer to state this clearly at the outset rather than after a pilot.

Invisible ERP

One scan.
One ledger.
Zero leaks.

Book the 15-minute demo · Request the compliance pack · Start a trial company

INTERNAL SALES ENABLEMENT · V1.0 · CONFIDENTIAL — DO NOT DISTRIBUTE

COMPANION ASSETS: INVESTOR PITCH DECK (16 PAGES) · SECURITY FACT SHEET (§14, STANDALONE-READY) · USER MANUAL & UAT SCRIPTS
