

 NASDAQ IPO track · SOX-ICFR ready

Next-Gen Enterprise ERP

A multi-tenant, Thai-localized ERP for food & beverage enterprises — bridging financial controls with supply-chain operations, from the diner's QR scan to the general ledger.

 Lean & fast — TypeScript end-to-end

 True multi-tenancy — Postgres RLS

 Omnichannel ready

THE PROBLEM

Legacy ERPs weren't built for this decade

Bulky and slow

Monolithic suites with multi-million-line codebases, upgrade cycles measured in years, and consultants required for every change.

Compliance as an afterthought

Access controls and segregation-of-duty rules are bolted on after the fact — making SOX audits painful, manual, and expensive.

Brittle integrations

Modern delivery marketplaces, payment gateways, and POS terminals are wired in through fragile point-to-point connectors that break silently.

F&B enterprises are forced to choose between **operational agility** and **financial control**. They shouldn't have to.

THE SOLUTION

A lean, high-performance architecture

~260k

LINES OF CODE — TOTAL

100%

TYPESCRIPT END-TO-END

1

SOURCE OF TRUTH — THE LEDGER

ONE ORDER, ONE FLOW — TABLE-SIDE SCAN TO AUDITED JOURNAL ENTRY

**Diner QR**

table-side ordering

**POS / KDS**

Next.js 15

**API tier**

NestJS · Fastify

**PostgreSQL**

Drizzle ORM · RLS

**General Ledger**

auto-posted, balanced

Modular bounded contexts

No batch lag — postings in the request

Registry-driven extension seams

SECURITY & COMPLIANCE

Uncompromised financial integrity

**Fail-closed by design**

If a control can't verify, the system refuses — it never silently allows.

24

USER ROLES

82

GRANULAR PERMISSIONS

26

SOD RULES ON GL POSTING

**Row-Level Security multi-tenancy**

Every query is tenant-scoped at the database itself.
The API even refuses to boot if its DB role could bypass RLS.

**Maker-checker everywhere**

No journal entry reaches the balances until a different human approves it — enforced in code, not in policy documents.

**SOX-ICFR readiness**

A living Risk & Control Matrix, process narratives, and automated control-test harnesses run on every change.

OMNICHANNEL SUPPLY CHAIN

Every channel in — one trusted tier out

Every external event is verified at the boundary before it can touch inventory or the ledger — **integrations that fail loudly, never silently.**

TRACTION & QUALITY ASSURANCE

Enterprise-grade, provably

100%

CORE-LOGIC TEST COVERAGE

0

DIFFS VS. GOLDEN MASTER

24/7

CI GATES ON EVERY CHANGE

**Golden zero-diff parity**

Every financial output is deep-compared against a pinned golden master. A single unintended satang of drift fails the build.

**CI/CD with down-only ratchets**

Control-test harnesses, migration gates, and code-quality ratchets that only ever tighten — technical debt can shrink, never grow.

**Enterprise SSO / SCIM**

Single sign-on and automated user provisioning out of the box — IT teams onboard and offboard staff from their existing identity provider.

 Multi-company fleet operations SoD-tested on every pipeline run

Ready for **scale**. Ready for **audit**.

IPO-grade controls with startup speed — one platform from the dining table to the audited financial statement.
